COMPLETE

Offerings from the COMPLETE Survey of Star-Forming Regions

The Coordinated Molecular Probe Line Extinction Thermal Emission Survey of Star-Forming Regions provides spectral-line, dust emission and dust absorption maps of the **Parsus, Ophiuchus**, and **Serpens** regions, observed by Spitzer in the **c2d Legacy Survey**. "Phase 1" of COMPLETE, released Jan. 2006, provides fully-sampled maps at arcmin resolution. "Phase 2," now well-underway, includes high-resolution mapping of the most prominent star-forming cores in each region.

Coverage in Parsus

COMPLETED Parsus Region (c2d)

COMPLETED Parsus Region (c2d)

COMPLETED Parsus Region (c2d)

COMPLETED Parsus Region (c2d)

COMPLETED Parsus Region (c2d)

Not all measures of column density are created equal!

Interpretation of column density maps based on ^{12}CO intensity, for thermal dust emission, and near-infrared extinction mapping reveals that extinction mapping is most reliably interpreted in terms of column density. ^{12}CO maps nearly match extinction maps (see text for details). ^{12}CO emission is subject to both physical and detection effects at density, leading to column density maps that are systematically low, high, or not spatially correlated. The near-infrared and thermal Parsus maps in COMPLETE (see below) and the distribution of column density is best represented by a single theoretical distribution (Goodman Ridge & Schnee 2006)

COMPLETED Parsus

A Giant, Warm, Shell in Parsus is Poking at the Molecular Clouds from Behind

One of the most often cited features in Parsus is a long chain of dark clouds (as it appears in ^{12}CO maps) that extends in a direction perpendicular to the main axis of the molecular cloud. Spectroscopic and ^{12}CO data, we show here, show that the shell of molecular gas is interacting on the "backside" of the clouds. Appreciation of this shell's existence allows re-interpretation of the nearby dust emission map (depicted with one component associated clouds) (Ridge et al. 2005, submitted)

Cores like cities!

COMPLETED Mapping of Ophiuchus c2d shows more extensive than earlier studies of roughly 4×10^4 mag. These low mag cores are found above a background of 3.2×10^4 mag. This low mag cores are found above a background of 3.2×10^4 mag. This low mag cores are found above a background of 3.2×10^4 mag.

Be on the lookout for "All the Outflow in Parsus" (Arce et al.), "COMPLETE++ Extinction Mapping" (Lombardi & Alves, 2008), "Atomic Gas in the COMPLETE Molecular Clouds" (Lu et al.), "The Real Phe-Oph Cluster, and Ring" (Lu et al.), "Astronomical Medicine" (Goodman et al.), "Clumping in Molecular Clouds" (Pineda et al.)

Alyssa A. Goodman, Principal Investigator (CIA), Joao Alves (ESO, Germany), Héctor Arce (AMNH), Tom Bethell (U. Wisconsin), Michelle Berkin (Harvard College), Paola Caselli (Arcetri, Italy), James DiFrancesco (NRC-HIA, Canada), Jonathan Foster (CIA, PhD Student), Michael Halle (SP1/BWH/HMS), Mark Heyer (UMASS/FCRAD), Di Li (CIA/JPL), Jason Lu (Harvard College), Doug Johnstone (NRC-HIA, U. Victoria, Canada), Helen Kirk (U. Victoria, Canada), David Kesteven (Harvard College), Marco Lombardi (ESO, Germany), Jaime Pineda (CIA, PhD Student), Naomi Ridge (CIA), Scott Schnee (CIA, PhD student), Mario Tafalla (OAN, Spain), Nathan Whitehorn (U. Chicago)

Data from COMPLETE are made freely available at the Survey's web site (take a Post-It Pad!)

Also "Phase 2" Summary Paper (Ridge 2006) is available online

"One temperature per pixel is not good enough!"

Schnee, Bethell & Goodman 2006 find that the scatter in the observed measurements of column density is primarily due to the scatter in the observed measurements of column density. The model and right panel above show that mean values for the full COMPLETE fields, individual spectra in the plane of emission, and individual spectra in the plane of extinction. The left panel shows the result of a synthetic observation of a number of molecular clouds using the same wavelength (850 and 1600 micron) noise level as in the COMPLETE images. Note that the scatter in the simulation is much smaller than in the actual data. The scatter in the simulation is much smaller than in the actual data. The scatter in the simulation is much smaller than in the actual data.

"Cloudshine" Dark Clouds Shine at 21st mag in J & H

A New Way to Map the Dense ISM with sub-Arsec Resolution (JHK filters)

Internal Structure of Dark Clouds

These images show the internal structure of dark clouds. The left panel shows the internal structure of dark clouds. The right panel shows the internal structure of dark clouds.

"Astronomical Medicine"

COMPLETED Mapping of Ophiuchus c2d shows more extensive than earlier studies of roughly 4×10^4 mag. These low mag cores are found above a background of 3.2×10^4 mag. This low mag cores are found above a background of 3.2×10^4 mag.

COMPLETE Greatest Hits, Volume 2

The Coordinated Molecular Probe Line Extinction Thermal Emission Survey of Star-Forming Regions provides spectral-line, dust emission and dust absorption maps of the **Parsus, Ophiuchus**, and **Serpens** regions, observed by Spitzer in the **c2d Legacy Survey**. "Phase 1" of COMPLETE, released Jan. 2006, provides fully-sampled maps at arcmin resolution. "Phase 2," now well-underway, includes high-resolution mapping of the most prominent star-forming cores in each region.

The Path to Newton

The Path to Newton

PREAMBLE:

Isaac Newton's theory of gravity was truly revolutionary. For the first time in history, all motion -- from celestial bodies in Space to objects on Earth -- could be mathematically described and predicted. Newton's theory necessitated new mathematics, Calculus, as well as a trove of empirical observations from which to derive and against which to test the math. The observations required instruments, the instruments required inventors, and the inventors required ideas, models, and conceptual systems that tried to make sense of the world and its physical phenomena. Over millennia, the ideas that led to Newton's built on earlier ideas through critique, amendment, and refutation. Newton's theory of gravity was not quite like the other ideas that drove our understanding of how the Universe moves forward, though--it was a monumental paradigm shift, from a world described by empirical rules, like those Kepler had discovered, to a world that could be predicted a priori--with no prior data about a system.

The Path to Newton is an attempt to demonstrate (some) of history behind how Newton knew what he knew and thought what he thought about motion. For many centuries, motion of objects in the Heavens (what we now think of as celestial mechanics) was considered categorically distinct from motion of objects on Earth (what was known as kinematics and, later, dynamics), so the Path focuses on philosophical and mathematical conceptions of the Universe and of how and why objects move on Earth, in order to explain how an ultimately unified theory of motion came to be.

Steps along the Path were facilitated by material technologies and greatly affected by religious doctrine, cultural exchange, and the migration and translation of ideas. The Path highlights the cultures, thinkers and tinkerers who wrestled ideas about motion into the stories, cosmologies, mathematics, tools, and data that lay before Newton as he worked. Each person highlighted along the Path stands in for a constellation of factors, often groups of people, that led to the historical recording or transmission of key ideas. While The Path employs these contributors as representatives and access points to seminal ideas and innovations necessary for a predictive theory of gravity, the immensity of the
